Learn how to setup and install TEEAL

On a local area network, networking directly from external drive
Contents of this presentation

1. What’s in the box?
2. Connect the drive
3. Check for and install required software
   2.1 Uninstall old TEEAL
   2.2 Check your Windows version
   2.3 Check for the .NET Framework
   2.4 Install the .NET Framework, if necessary
4. Set up sharing for the external drive
5. Install and run TEEAL
1 What’s in the box?

- 1 hard drive
- 1 USB cable

Documentation:
- Setup and Installation Guide
- Quickstart Sheet
- Getting Started brochures (5)
- Help Packet
2 Connect the drive to a host computer on your network
1. Connect the small end of the USB cable to the hard drive.

2. Connect the large, flat end to the server.

3. Wait for the computer to recognize the hard drive. You will see a green arrow icon appear in the system tray.
Check for required software

Install .NET Framework

Note: You must do this for all computers on your network that will run TEEAL.
1. Do you have the old version of TEEAL on your computer? If Yes, then uninstall it (Step 2 on this slide). If No, then proceed to page 3.2.

2. Go to Start > Control Panel > Add/Remove Programs.

3. Scroll down the list and find TEEAL for Networks. Click on Remove. Follow the instructions.
3.2 Check for required Windows version

- Do you have either Windows 2000, Windows XP, or Windows Vista?
- To check your Windows operating system:
  1. Right-click My Computer. Click Properties. The text on the right side will tell what kind of operating system you have.
  2. In this example, the computer has Windows XP. It has the necessary software to run TEEAL.
- If you do not have this software, you will not be able to run TEEAL.
3.3 Check for .NET Framework

- Do you have the .NET Framework installed?
  - To check, go to Start > Control Panel. Choose Add/Remove Programs. Scroll through the list to find Microsoft .NET Framework 2.0 (you need 2.0 or higher).
  - If you have it, go to section 4. If not, go to the next page.
2.4 Install the .NET Framework

1. Open **My Computer > TEEAL**.
2. Open **Additional Files**. Double-click **dotnetfx.exe**.
3. Follow the setup instructions.
Set up sharing on your network for the external drive*

*Access to TEEAL is limited to your local area network. You may not put TEEAL on the Internet.*
1. On the host computer (where you connected the hard drive), open *My Computer*.
2. Right-click the TEEAL drive and choose *Sharing and Security*. 
3. Click the Share this folder button.  
4. Create the share name teeal.  
5. Click OK.
6. Complete Steps 7-11 on each client computer on your network that will access TEEAL.

7. Right-click on My Computer, and select Map Network Drive.

8. Change the drive to any letter but Z. This is very important!

9. In the Folder line, type in the IP address of your server followed by \teeal. (See example below). It should resemble the following format: \153.278.36.44\teeal. See example below.
10. If done correctly you should see a new drive letter in My Computer with the title “*teal on 153.278.36.44*” (with your IP address).

11. Sometimes this folder will automatically open for you.
5 Install TEEAL

Note: You must do this for each computer on your network that will run TEEAL.
1. Open the network drive you just created in Section 2--double-click on “teeal on 153.278.36.44 (T:)” (your IP address will be different).

2. Scroll to the bottom and double-click TEEAL Setup.exe.

5.1 Install TEEAL
Follow the setup instructions. It may take a few minutes.
5.2 Run TEEAL!

- Launch TEEAL by clicking on the icon on your desktop!
- Your default browser (usually Firefox or Internet Explorer) will open and display the Home Page of TEEAL.
- Now you can start using TEEAL!

TEEAL, ready for a Quick Search of the journal citation database.
